

ABSTRACT OF THE DISCLOSURE

A server computer coupled to a CTI capable telephone or a Teleworking Server coupled to a PBX is
5 also coupled to a wireless gateway/router and is provided with communications software. A personal digital assistant with wireless capabilities or a cell phone with computing capabilities is provided with corresponding communications software for communicating via the
10 wireless network with the server. The server monitors one or more phone numbers associated with each client. When a call comes in, the server immediately notifies the client. The client can direct the server to transfer the call to a nearby phone. This can be accomplished by
15 parking the call in a system slot and by retrieving the call with a nearby desk phone, thus not needing to know the number of the desk phone. Otherwise, the client can have the call forwarded to another telephone number. The client can also redirect the call to voicemail or a
20 personal messaging system.
